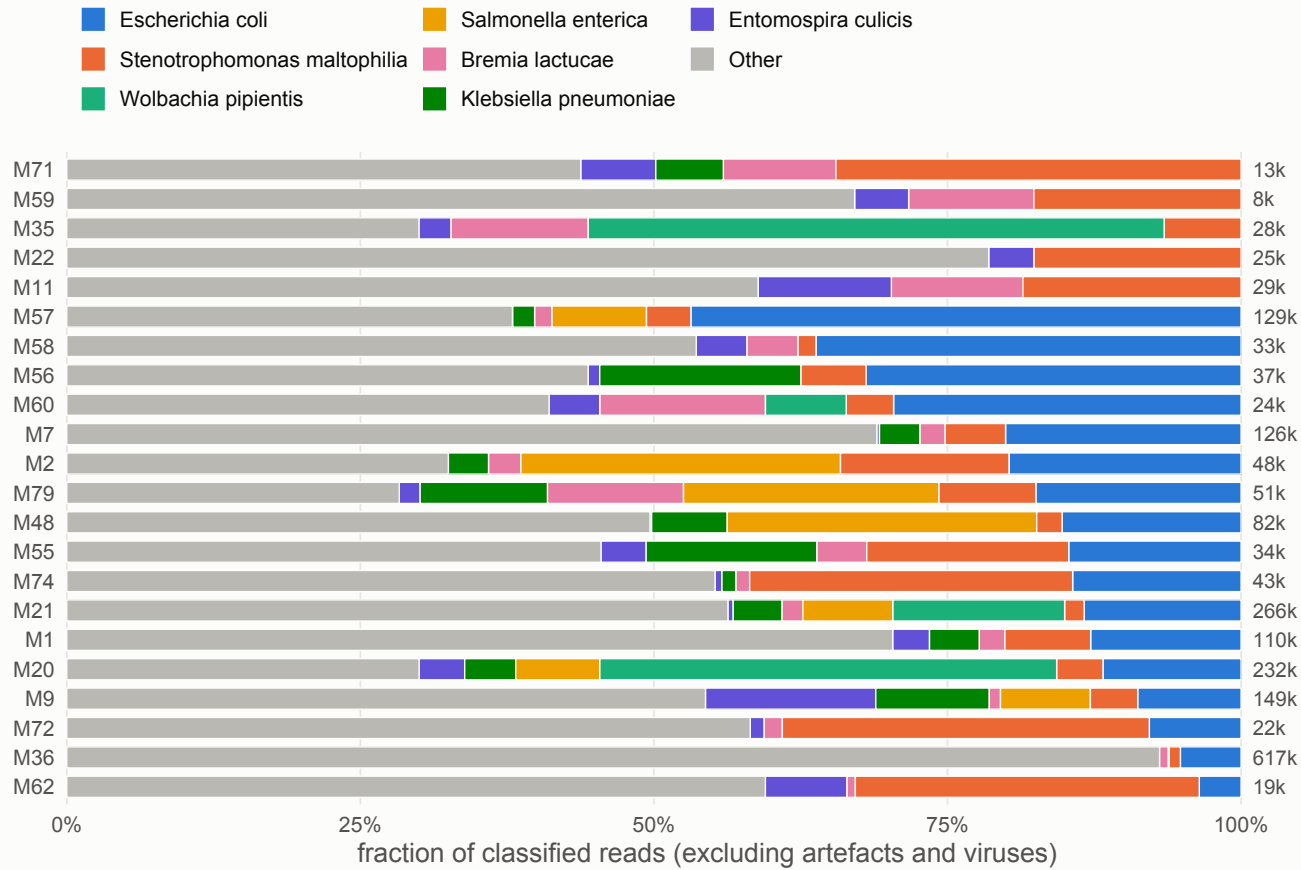
Bacterial and eukaryotic composition of non-host reads

The 7 most abundant taxa on average; Bracken level S; fractions re-normalised



Removed before normalising: Homo sapiens and Plasmodium (residual mosquito rRNA assigned to the closest eukaryote, as PlusPF has no insect genomes) and viral taxa (analysed through the vOTUs; Kraken2 assigns them to the closest reference). They made up 46–100% of the classified reads per pool. Right: reads left in each pool.
